

User Acceptance Testing (UAT) Template

Date	18 June 2026
Team ID	
Project Name	ShopEZ
Maximum Marks	

Project Overview:

Project Name: ShopEZ

Project Description: [Brief Description of the Project]

Project Version: Version 1.0

Testing Period: 1 June 2026 to 15 June 2026

Testing Scope:

Features and Functionalities to be Tested

- **User Authentication Engine:** Complete validation of guest user registration workflows, secure login parameter matching, cryptographic password hashing via bcryptjs, and stateless JSON Web Token (JWT) issuance, delivery, and client-side validation loops.
- **Role-Based Access Control (RBAC) & Route Guarding:** Verification of client-side route protection boundaries to prevent unauthorized URL parameter entry, alongside server-side middleware validation that explicitly blocks unprivileged requests with 403 Forbidden statuses.
- **Context-Aware Adaptive UI Rendering:** Testing dynamic client-side layout adjustments that evaluate product categories on the fly to seamlessly toggle interface components, ensuring clothing size selectors cleanly hide when viewing electronic or home decor listings.
- **Client-Side State & Session Persistence:** Robust state synchronization testing to ensure shopping cart, wishlist, and session arrays remain fully intact across route navigation changes, forced page reloads, and browser session terminations using the React Context API.
- **Administrative Dashboard Analytics:** Real-time verification of backend database query aggregation metrics tracking business health statistics, including cumulative user registrations, global product inventories, and active order volumes.
- **Fulfillment Optimization & Reporting Utilities:** Automated order state tracking from creation to delivery, paired with native data-flattening utilities to trigger downloadable tabular .csv files and print-optimized physical invoice generation via @media print CSS configurations.

User Stories or Requirements to be Tested

- **USN-1 & USN-2 (Secure Guest Entry & Login):** Verifying one-way encryption mechanics using salt-hashed databases, validating interface input field constraints, confirming unique email database rules, and validating secure local storage token handshakes.
- **USN-3 & USN-7 (Category-Aware Sizing Matrices):** Evaluating UI layout flexibility across customer storefront display modules and backend administrative forms to guarantee that category rules show or hide sizing selectors without breaking responsive grids.
- **USN-4 (Persistent Shopping Sessions):** Confirming continuous data retention and zero data loss inside active shopping baskets during accidental browser tab drops, network timeout states, or page updates.
- **USN-5 (Deterministic Token Routing):** Validating automatic page routing upon login, mapping administrators straight to protected dashboard panels and regular customers to catalog index pages, while guarding private paths against unauthorized access.
- **USN-8 & USN-9 (Operational & Accounting Management):** Testing interactive order status lifecycle toggles, auditing server-side data conversion streams into downloadable .csv files, and checking print-friendly physical receipt layouts that cleanly strip away interactive web elements and menus.

Testing Environment:

URL/Location: [Web URL or Application Location]

Credentials (if required): [Username/Password]

Test Cases:

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Customer Checkout Validation & Completion	1. Click the "Checkout" CTA button to navigate to /checkout. 2. Leave the "Mobile Number" field empty, fill out all other shipping details, and click "Confirm Order". 3. Verify that the form throws a validation alert. 4. Input a valid 10-digit number (9999999999) into the mobile field and click "Confirm Order".	The form successfully blocks empty mobile entries with an alert. Upon valid inputs, the order is created, the user is redirected to the Profile page showing "order placed" status, and the shopping cart is automatically cleared	The system successfully enforces form validations, logs distinct orders, and flushes the checkout basket on completion.	Pass
TC-002	Admin Product Management & Storefront Configuration	1. Select the "Add Product" menu inside the admin dashboard. 2. Input product details (Category: "Fashion", Price: 1000, Discount: 10, Sizes: M, L) and click "Create Product".	The administrative dashboard saves the product configurations and banner asset rules. The public customer storefront instantly renders the updated banner and	The homepage banner and product catalog collections dynamically mirror the changes pushed from the admin cockpit.	Pass

		3. Select the "Configuration" menu, update the promo banner URL, and save. 4. Log out, log in as a Customer, and view the homepage /.	lists the new discounted fashion product under matching sidebar filters.		
TC-003	Customer Profile History & Cancellation Check	1. Open /profile and verify the order is displayed in "order placed" status with a visible "Cancel Order" button. 2. Click "Cancel Order" and confirm the safety prompt. 3. Verify the cancel button is hidden and status updates to "cancelled". 4. Log out, log in as a different Customer, and attempt to target that order ID using a raw cancellation API request.	The cancellation button alters the database status field to "cancelled" in real-time and hides the action element. Malicious cross-account cancellation attempts hitting the backend API routing layer return a strict 403 Forbidden response.	The interface securely manages order states, and cross-user parameter manipulation routes are fully blocked by middleware guards.	Pass

Bug Tracking:

Bug ID	Bug Description	Steps to reproduce	Severity	Status	Additional feedback
BG-001	Cart Item Quantity Concatenation (String Type Schema Conflict)	1. Log in as a customer and add 1 unit of a product to the cart. 2. Return to the catalog page, select the same product, and add 2 units of the exact same size. 3. Navigate to the Cart Page and view the total item quantity.	High	Closed	Fixed. Added strict parseInt wrapping logic inside the backend Express addToCart controller handler and enforced numeric parsing on the client-side before running receipt summation steps.
BG-002	Out-of-Sync Cart Count on Multi-Tab Browsing	1. Open the web application concurrently inside two independent browser tabs. 2. In tab A, add a product to the cart to shift the visible cart bubble badge count to 1. 3. Switch to tab B and view the navbar cart count tracking metric without refreshing the window layout.	Medium	Open	A proposed architectural fix is scheduled to bind a native browser window storage event handler to listen across local storage scopes and immediately sync cart counts across disjointed browser tabs.

BG-003	Dark Theme Visual Bleeds on Admin Logout	1. Log in as an Admin and navigate to /admin to force the interface into the high-contrast dark dashboard layout theme. 2. Click the administrative "Logout" action link. 3. Log back in immediately under a standard Customer profile account credential.	Low	Closed	Fixed. Added an explicit <code>document.body.classList.remove("admin-theme")</code> function clean-up routine command directly inside the core <code>global handleLogout()</code> session execution loop script.

Notes:

- Ensure that all test cases cover both positive and negative scenarios.
- Encourage testers to provide detailed feedback, including any suggestions for improvement.
- Bug tracking should include details such as severity, status, and steps to reproduce.
- Obtain sign-off from both the project manager and product owner before proceeding with deployment.
